(1) The observations do not follow a consistent periodicity due to historical documentation limitations.

Male Population: the data suggest that, beginning in 2008, the proportion of offenders in minimum custody has been decreasing while the close custody population has been increasing. In June 2007, the minimum and close custody were nearly equal in ranking. As of September 2009, minimum dropped from 22% to 13% and close increased from 23% to 28%. The medium custody population; however, has been remaining stable.

Female Population: the trend in the data reveal that actual minimum custody is decreasing and close custody is increasing. As of September 2009, close and minimum custody were nearly equal while medium custody maintained its ranking as 3rd in hierarchy. In June 2007, the minimum custody population comprised 43% of the population while close custody comprised 6%. As of September 2009, minimum custody shifted downwards to 22% and close shifted upwards to 21%.

ASSIGNED VS. UNASSIGNED CUSTODY

GENDER	ACTUAL	UNSSG	TOTAL
FEMALE	920 96.23%	36 3.77%	956 100.00%
MALE	11173 97.45%	292 2.55%	11465 100.00%
TOTAL	12093 97.36%	328 2.64%	12421 100.00%

(1) This method is changed as of March 2007 and it aggregates custodies as follows:

min= 1 & 2 (com trust & min)

med= 3 (medium)

close= 0, 4, & 5 (unassigned, close, and max)

(2) The old method excluded inmates who were unassigned.

(3) The in-house populations by gender don't balance to the actual in-house populations reported in Report 1.1 dated as the last day of the month given that SKI, SKC, and SKF inmates are excluded from the distribution.

⁽¹⁾ Total population and trace factor forecasts were derived by JFA in March 2009 and the in-house forecast was derived by NDOC through an adjustment.

⁽²⁾ Actual in-house and total populations were obtained from NDOC's daily count sheets.

⁽³⁾ Actual admissions and releases obtained from NOTIS and daily count reconciliations.

⁽⁴⁾ RMSE= Square root of the mean squared errors (the difference between actual and forecast).

⁽⁵⁾ % RMSE/AVG = RMSE as fraction of actual average.

FEMALE POPULATION COMPARISON

OUTCOUNT POPULATION

A Double Holt method was applied to forecast the female outcount population. The method modeled the trend in the data fairly well as it captured the expected downward trend. Between April and September 2009, the female population projection decreased from 6.25% to 3.89% of the total female population.

A Holt Winters method was applied to forecast the male outcount population. The model captured the consistency in the pattern of the data very well and projected fairly close. In April 2009, the male outcount population was 2.81% of the total population. This outcount population ranged between 2.7% in May and 2.40% in September.
